

HKC-T1500 CCD BLOCK EXTENSION ADAPTOR

INNOVATIVE FEATURES

The HKC-T1500 CCD block adaptor is a unique accessory for the HDC-1500 and HDC-1550 portable HD cameras. It allows them to be split into two parts: the CCD block and the camera body.

The CCD block and lens are very compact and can be fitted onto a jib, giro-stabilised helicopter mount or other remote location. The CCD is connected to the camera body by the 12.5 metre cable supplied, or up to 50 metres away with an optional cable.

The CCD block-housing includes the option for a viewfinder and intercom, and can therefore be used as a lightweight camera solution where a conventional HD camera would be uncomfortable or awkward for the operator.

The system allows more creative camera shooting angles and the freedom to place the imaging assembly where a full size camera would not fit or would be obtrusive. Stunning High Definition images can now be acquired from new, difficult or hostile locations.

The HKC-T1500 includes a new housing for the optical block, a cable adaptor for the front of the camera body and a connecting cable (12.5 m). It can easily be fitted to a donor HDC camera by the end-user.
